

Abstract of the Disclosure

Methods and systems for automatically generating computer code for industry standards reporting are disclosed. A programmer writes core industry standards rules computer code based on industry standards reporting rules.

- 5 The core industry standards rules computer code is independent of user data formats or locations. A user inputs user-specific data formats and locations in a mapping table that links industry standards reporting rules to the user-specific data formats and locations. A translation script automatically translates the core industry standards rules computer code into user-specific industry
- 10 standards rules application code based on the data stored in the table. When the industry standards reporting rules change, the core industry standards rules computer code is updated and the translation is re-executed to generate user-specific computer code.
